

HOW TO INTERPRET YOUR FIRST SCAN TEST WITH OLIGOLAB REPORTS

Once you perform your test using your scanner (whether version2/4hand readings or version3/3hand readings)- you may process it to your Oligolab account and start to use your chosen reports (purchase).

The first correlation should be with the Cell Map report (check: how to interpret your first Oligolab Cell Map report file) as a routine tissue (cellular) check on multi-levels (vital signs, biochemical, nutritional, metabolic, and functional-please check attached file).

You may proceed to Services' Map report too (purchase) to promote your services according to your Cell Map report findings.

PS: Cell Map report constitutes basic comments for proper cell –hence organ-function, and energy production.

Oligolab software uses a circle model (donuts of health) where each circle represents one health item (acidosis, glycation, yoga,etc...).

At this stage, you may depend on your skills and experience to manage your client health or you proceed to get more Oligolab reports (purchase) for more interpretation:

- A) Go to script to balance scan test values to get the solution to improve your client's condition.

The script allows you to get the recommended supplements-oral or IV infusion, diet and nutrition protocol, detox program, lab. Request, etc...

- B) Go to general or patient recommendation reports for full cell examination of your client health-this is equivalent to full organ examination by physicians but it depends on biochemical not clinical approach – check oligolab methodology (please refer to how to read standard or oligohealth test at web site www.oligolab.org).
- C) Go to specialty option to check the clinical condition of each organ (functional reports) based on specialty (which gives you the possibilities of past, present or even future health problems)

D) Go to clinical specialty and/or recommendation reports for full and fast scanning to all organ functions and tissue ratios of potential health imbalance.

Go to Mini-donuts' intervention reports- of oligohealth reports (on the hour tracking reports of energy expenditure) that cover all previous health items (acidosis, glycation, yoga,etc..) for easier population interaction (users'friendly model)

PS: Oligolab reports have no false-positive results as all information is derived from approved health libraries (it detects hidden causes of symptoms or signs) so its findings may reflect not only past or present history but also future possibilities regarding your clients' health conditions (preventive and predictive).

For example, if you find a circle with acidosis (biochemical health item) in red color, it means that your cell state is not balanced so you may check history or TAKE AN ACTION. If you find cough in chest specialty, take a history from your client and so on.

The same is true for any circle at any level of Cell Map report (vital cell sign, biochemical, nutritional, or metabolic) and its implementation on other Oligolab reports at other levels too (functional, services, clinical or therapeutic) as Oligolab reports are interactive and provide the full picture about health conditions and the reasons behind it.
